

COMIC STORY

A Marvel-Themed Digital Comic Library Website

Project Documentation

Built with HTML5 · CSS3 · JavaScript (ES6)

Main file: COMIC_CRAFT_1.html

1. Overview

Comic Story is a front-end portfolio project that presents a curated comic collection through a cinematic, comic-book-inspired interface. It demonstrates responsive layout design, CSS theming with variables, DOM manipulation, client-side search and filtering, modal dialogs, localStorage persistence and scroll-based animations.

The entire website lives in a single file, COMIC_CRAFT_1.html, with no frameworks, libraries or build tools.

Why Comic Story?

Comic fans usually scatter their favorite titles across bookmarks, notes and shelves. Comic Story brings them together in one place that feels like opening a real comic book: bold colors, dramatic posters and hero-themed storytelling.

Project Highlights

- **Immersive superhero experience:** a Marvel-inspired red, blue and gold theme on a dark cinematic background.
- **Complete comic library:** ten iconic titles, from Marvel Comics and Iron Man to Avengers: Endgame and Spider-Man.
- **Instant discovery:** live search and category filters help visitors find a title in seconds.
- **Personal collection:** visitors can save favorite comics, and the choices persist between visits.
- **Cinematic posters:** large featured artwork displays give the site a gallery-style look.
- **Story-driven design:** character cards and "The Journey" timeline tell the story of the universe.
- **Light and dark modes:** visitors pick the viewing style that suits them.
- **Works on every screen:** a responsive layout adapts to phones, tablets and desktops.
- **Fast and lightweight:** one file, no dependencies and no installation.
- **Beginner-friendly code:** clean, well-commented HTML, CSS and JavaScript that is easy to learn from and extend.

Who Is It For?

Audience	Value
Comic and Marvel fans	A stylish place to browse and collect favorite stories
Students and learners	A practical example of a complete front-end project
Recruiters and reviewers	A portfolio piece showing design and JavaScript skills
Developers	A ready base to extend with a backend or more content

Skills Demonstrated

Responsive Web Design · CSS Variables and Theming · Flexbox and Grid · DOM Manipulation · Event Handling · Search and Filter Logic · Modal Dialogs · localStorage · Intersection Observer · UI/UX Design

2. Features

- Animated preloader with logo and progress bar
- Fixed, blurred navigation header with smooth-scroll links
- Hero section with call-to-action buttons
- Statistics counters (books, heroes, posters)
- Comic library of 10 titles with live search, category filters (All, Marvel, Avengers, Heroes, Classics) and a "no results" message
- Book detail modal that closes with the X button, an outside click or the Esc key
- Favorites system to save or remove titles, remembered between visits
- Toast notifications for user actions
- Poster collection with large cinematic displays
- Character cards with symbol, name and role
- Timeline ("The Journey") with six milestones
- Newsletter signup form with email validation
- Light / dark theme toggle
- Responsive design with a mobile hamburger menu
- Scroll-to-top button and scroll-reveal animations
- Keyboard shortcut: press / to jump to the search box

3. Tech Stack

Technology	Purpose
HTML5	Semantic page structure
CSS3	Styling, CSS variables, gradients, animations, media queries
Vanilla JavaScript (ES6)	Interactivity and logic
Web Storage API (localStorage)	Saving favorites
Intersection Observer API	Scroll-reveal animations

No external libraries, fonts or dependencies are required.

4. Project Structure

```
comic-story/  
|-- COMIC_CRAFT_1.html    (the complete website: HTML + CSS + JS)  
|-- images/               (book covers and posters)  
|   |-- MarvelComics.jpg  
|   |-- avengers.jpg  
|   |-- ...  
`-- README / documentation
```

Note: the HTML file currently references images using local Windows paths. See Known Limitations for how to fix this before publishing.

5. Getting Started

Run locally

- 1 Download or clone the project.
- 2 Put your image files in an images/ folder next to the HTML file.
- 3 Double-click COMIC_CRAFT_1.html to open it in your browser.

No installation, server or build step is needed.

Deploy online (free)

- **GitHub Pages:** rename the file to index.html, push it to a repository, then enable Pages in the repository settings.
- **Netlify or Vercel:** drag and drop the project folder.

6. Page Sections

Section	Description
Home (Hero)	Headline, intro text and buttons leading to the library and posters
Stats	Summary numbers for the collection
Library	Searchable, filterable grid of 10 comic titles
Posters	Two featured poster displays
Story blocks	Short story texts in a highlighted red section
Characters	Hero cards: Iron Man, Captain America, Thor, Hulk, Black Widow and more
Timeline	Marvel Comics, Individual Heroes, The Avengers, Infinity War, Endgame, Spider-Man
About	Project description with READ / EXPLORE / COLLECT panels
Newsletter	Email signup form
Footer	Site links and information

Library titles: Marvel Comics, Iron Man, Captain America, Thor, Hulk, Black Widow, The Avengers, Avengers: Infinity War, Avengers: Endgame, Spider-Man.

7. How It Works

Search and filter. Each book card has data-title and data-category attributes. The filterBooks() function compares every card with the search text and the active filter button, then shows or hides cards to match.

Detail modal. Book descriptions are stored in a comicData JavaScript object keyed by title. Clicking a card looks up its entry and fills the modal.

Favorites. Saved titles are stored as a JSON array in localStorage under the key comicStoryFavorites, so they persist after refreshing or closing the browser.

Theme toggle. The theme button adds or removes a light-mode class on the body element, and the CSS restyles the page accordingly.

Animations. An IntersectionObserver fades and slides cards, characters, posters and stats into view as they enter the screen.

8. Customization

- **Colors:** edit the CSS variables at the top of the style block (--red, --blue, --yellow and so on).
- **Add a book:** copy an existing book-card block, update its data-title, data-category and data-book values, and add a matching entry to the comicData object.
- **Change categories:** edit the data-filter values on the filter buttons and the data-category values on the cards.
- **Change images:** replace files in the images folder or update the src paths.

9. Browser Support

Works in current versions of Chrome, Edge, Firefox and Safari. Older browsers without IntersectionObserver or localStorage support may not display all features.

10. Known Limitations

- **Image paths:** images currently point to local paths such as C:\Users\...\MarvelComics.jpg, so they will not load on other computers or when hosted. Move the images into an images/ folder and change the paths to relative ones, for example images/MarvelComics.jpg.
- **No backend:** the newsletter form does not send data anywhere. Favorites and theme settings exist only in the visitor's own browser.
- **Static content:** all books, characters and timeline entries are written directly in the HTML.

11. Future Improvements

- Favorites-only view
- Sorting options (title, rating)
- Real newsletter integration
- Loading book data from a JSON file or API
- Individual detail pages for each character
- Separate CSS and JS files for easier maintenance

12. Conclusion

Comic Story shows that a polished, professional website doesn't need heavy frameworks or complicated tools. With just HTML, CSS and JavaScript, it delivers the things a modern web project should have:

- **A strong visual identity:** a bold, cinematic superhero theme that is instantly memorable.
- **Real interactivity:** search, filters, favorites, modals, notifications and animations that respond to the visitor.
- **Thoughtful user experience:** responsive on all devices, with light and dark modes and keyboard shortcuts.
- **Clean, scalable code:** organized so new comics, characters and features can be added easily.
- **Practical learning value:** a complete example of how front-end pieces fit together in one project.

More than a comic catalog, it is a celebration of the stories and heroes that have inspired generations of readers, presented in a way that fans can explore, enjoy and make their own.

With a backend, user accounts and a larger comic database, Comic Story can grow from a front-end showcase into a full comic platform. Every hero begins with a first chapter, and this project is the first chapter of that story.
